1.0 Introduction

The Clipsal 752/225CUI automatic sensing device is a dual technology motion detector.

The significant feature of the 752/225CUI is that it uses both ultrasonic and passive infrared (PIR) technologies to perform the ultimate task of sensing, employing a programmable DIP switch for the actual environmental conditions.

This means that combinations of both ultrasonic and infrared can be programmed to suit the actual conditions of the environment resulting in ultimate performance.

2.0 How it Works

2.1 Ultrasonic Detection

The 752/225CUI consists of a transmitter and a receiver transducer to provide total volumetric sensing with no blind spots.

2.2 Passive Infrared Detection

The 752/225CUI consists of four PIR detectors which are specially aimed to all four corners of the room to ensure the farthest distances of the room are covered. The 752/225CUI can detect an area up to 15m x 15m (225m²).

The sensor operates on 24V d.c. and is designed to work with the 752PR power pack and relay switching module (supplied).

When someone enters a room in which the sensor controls the lighting, the lights are turned on automatically. The signal derived activates an adjustable timer (30 seconds to 30 minutes), which in turn activates an electrical relay in the power pack, turning the lights on.

If no movement or presence is detected for the time selected, the relay de-energises, turning the lights off.

The 752PR device has a C-Bus auxiliary unit connection terminal which is to be connected only to a C-Bus L5504AUX or C-Bus bus coupler unit.
3.0 Identification of Parts

3.1 Detector

Programme Selector (refer to Program Selections Schedule page 8).

Sensitivity Adjustment for Ultrasonic Detection (page 9).

Time Delay Adjustment (refer to Time Delay Table page 9).

6 way connectors

Back Mounting Plate

84mm Mounting Centres

Ultrasonic Sensors

PIR Sensor Windows

Adjustment Access Cover

752LD 1 Metre Lead
3.2 Power Supply

Cut out to suit load cable

PCB Fixing screws

Incoming mains supply cable

752LD Lead

Connector for 752LD (Lead to sensor)

Load output terminals

Output for connection to C-Bus bus coupler or auxiliary unit

4.0 Location

The best position to mount the sensor is on the ceiling in the centre of the room. It has a nominal coverage of 15m x 15m (225m²) with 360° coverage.

Note: Do not mount close to objects which can change temperatures rapidly e.g. air-conditioning vents, heater flues.
5.0 Detection Pattern

Field of View

Combination Detection Pattern
- Area of Detection
- Passive Infrared
- Overlapping Detection Passive Infrared/Ultrasonic
- Area of Detection Ultrasonic

Detection patterns are based on 3m ceilings and tiled floors. In large carpeted areas, a higher sensitivity for ultrasonic may be required to overcome the absorption of the ultrasonic waves by the carpet.

6.0 Eliminating Unwanted Detection

The masks supplied in this package are used to block the detection of PIR when that area is not required.

Sample Masking Segments

Masking Instructions
To mask a lens segment, use only the mask supplied with the unit and cover only the lens segment which is viewing the potential problem area, such as an open doorway.
### 7.0 Mounting Procedure

1. Fit power supply in ceiling space within 1m of sensor position. (Fit surface mount socket or similar for supply from lighting circuit.)
   a. Fix base of power supply to beam.
   b. Fix PCB to base using screws provided.
   c. Fit 752LD (1m lead) to connector on PCB at extra low voltage end.
   d. Fit load cables to terminals on PCB, stripped to length as shown.
   e. Cut out cover as required to suit load cables.
   f. Screw cover to base.

2. Fit sensor to ceiling in (a predetermined) position.
   a. Fix mounting flange to ceiling.
   b. Cut hole for 752LD lead cable (Ø20mm hole).
   c. Fit 752LD lead to sensor.
   d. Fix sensor to mounting flange and secure using side fixing screws.

### 8.0 Wiring Diagram

Warning

It is recommended that this product should be hard wired as per the wiring diagram. When connecting multiple 752PR modules to control the same load, 3 pin plugs or similar must not be used, as this can result in the plugtop pins becoming 'live' under certain conditions.

For safety reasons, it is recommended to always shut down power to all relevant circuits before undertaking any installation or maintenance of this product.
9.0 Commissioning

Once power has been installed, determine which program selection schedule best suits the application.

Program Selections Schedule

#1 PROGRAM SELECTION is used in common office areas. Multi-sensor application using this program selection will enhance the detection that is needed in partitioned office areas.

Note: This program uses only ultrasonic detection.

#2 PROGRAM SELECTION is used in areas in which turbulence, such as air draft or high air flow, is a problem.

Note:
   a) This program uses only passive infrared detection.
   b) If environmental conditions are too severe for this program selection, use program selection #5 instead.

#3 PROGRAM SELECTION is used in areas in which high sensitivity is needed and no turbulence or adverse environmental conditions exist.

Note: This program selection permits maximum sensitivity for dual sensor technology.

#4 PROGRAM SELECTION is used in rooms and areas that demand high sensitivity once the room has been occupied, but cannot be falsely triggered by the high turbulence, (hanging mobiles, etc.) such as in classrooms.

Note: Sensitivity increases after lights are switched on.

#5 PROGRAM SELECTION is used in areas where turbulent conditions exist in which no other program selection can satisfy.

Note: This program selection requires both ultrasonic and passive infrared detection simultaneously to occur in order to trigger the timing circuit that will ultimately keep the lights on.
9.1 Time Delay Table
Set the timer delay to suit, as per the table below:

Example of timer settings in minutes

<table>
<thead>
<tr>
<th>Room</th>
<th>Timer Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stock Room</td>
<td>#15</td>
</tr>
<tr>
<td>Hallway</td>
<td>#10</td>
</tr>
<tr>
<td>Restroom</td>
<td># 7</td>
</tr>
<tr>
<td>Office</td>
<td># 8</td>
</tr>
<tr>
<td>Classroom</td>
<td># 9</td>
</tr>
</tbody>
</table>

**Note:** For areas larger than 10m², set timer adjustment to #5 and perform walk testing using the actual light fixtures. After the walk testing is completed, set timer adjustment to #15.

9.2 Approximate Sensitivity Adjustment
Set sensitivity adjustment to suit as per size of the room, shown below:

**Ultrasonic detection**

<table>
<thead>
<tr>
<th>Room Size</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>10m² room</td>
<td>#1</td>
</tr>
<tr>
<td>27m² room</td>
<td>#2</td>
</tr>
<tr>
<td>46m² room</td>
<td>#3</td>
</tr>
<tr>
<td>65m² room</td>
<td>#4</td>
</tr>
<tr>
<td>83m² room</td>
<td>#5</td>
</tr>
<tr>
<td>93m² room</td>
<td>#6</td>
</tr>
</tbody>
</table>

**Note:** When logic key or paper clip is inserted into the slot, lights will always be on. There is no shock hazard present when using a logic key or a paper clip.

This bypass function is for emergency use only.

10.0 Logic Bypass Function

**Note:** When logic key or paper clip is inserted into the slot, lights will always be on. There is no shock hazard present when using a logic key or a paper clip.

This bypass function is for emergency use only.
### 11.0 Technical Specifications

### 752 Power Supply and Switched Module

| Operating Voltage Range | 192V a.c. min.- 265V a.c. max. |
| Rated Nominal Voltage | 240V a.c. |
| Operating Frequency | 50Hz |
| Output Power | 7VA max. @ 240V |
| Unfiltered d.c. Voltage Output @ 240V a.c. Input (no load) | 24V max. |
| Continuous d.c. Load Current Allowed | 100mA max. |
| Switched Active Contact Rating (N.O.) | 240V a.c. 10AX max. Suitable for fluorescent, inductive and incandescent loads. |
| C-Bus Output Connection | Compatible with C-Bus bus coupler or auxiliary unit. |
| Operating Temperature Range | 0°C min. - 50°C max. |
| Number of 752 Series Motion Detectors allowed to connect | One |
## 12.0 Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution A</th>
<th>Solution B</th>
</tr>
</thead>
<tbody>
<tr>
<td>The power is restored. Both the red and green LEDs do not blink when making motion.</td>
<td>Adjust sensitivity and set level to a higher setting as required by observing red and green LEDs.</td>
<td>Remove sensor and measure if 24V d.c. is present between red and black leads. If no voltage is present, check power connection and power/switch pack. If voltage is present, replace sensor with new one and send defective sensor to Clipsal Australia Pty Ltd.</td>
</tr>
<tr>
<td>Lights are on continuously and do not shut off when no one is present.</td>
<td>Re-check all your connections then disconnect sensor while power is still on. If lights remain on, this indicates that there is a short in the 752LD Lead connecting the sensor and the power/switch module. Solution to this problem is to replace the 752LD Lead. Check also for external causes such as excessive turbulence (hanging mobiles, etc). Refer to Program Selection schedule on page 8 for detector options.</td>
<td></td>
</tr>
<tr>
<td>Lights will not switch on even after sensor is disconnected and red and blue wires are shorted.</td>
<td>This could indicate a broken wire in the 752LD Lead. Next, disconnect the 752LD Lead at the power/switch module and short the pins where the red and blue wires connect. If lights still do not switch on, replace power/switch module after checking if all connections were made correctly.</td>
<td></td>
</tr>
<tr>
<td>LED blinks but lights will not switch on.</td>
<td>Check if sensor is working when bypassing all electronics. This can be done by inserting the key provided with each unit. If lights switch on, replace defective sensor.</td>
<td></td>
</tr>
<tr>
<td>After all connections are verified, lights stay on when no one is present, and from time to time LED blinks.</td>
<td>Red LED blinks. Check for hot air turbulence and mask lens for PIR detection in accordance with figure on page 6 (6.0).</td>
<td>Green LED blinks (ultrasonic). Turn sensitivity adjustment to a lower setting and/or physically rotate sensor by 90°. (Refer to page 8).</td>
</tr>

13.0 Warranty

1) The benefits conferred herein are in addition to, and in no way shall be deemed to derogate; either expressly or by implication, any or all other rights and remedies in respect to Clipsal Product, which the consumer has under the Commonwealth Trade Practices Act or any other similar State or Territory Laws.

2) The warrantor is Clipsal Australia Pty Ltd of 33-37 Port Wakefield Road, Gepps Cross, SA 5094. With registered offices in all Australian States.

3) This Clipsal Product is guaranteed against faulty workmanship and materials for a period of two (2) years from the date of installation.

4) Clipsal Australia Pty Ltd reserves the right, at its discretion, to either repair free of parts and labour charges, replace or offer refund in respect to any article found to be faulty due to materials, parts or workmanship.

5) This warranty is expressly subject to the Clipsal Product being installed, wired, tested, operated and used in accordance with the manufacturer’s instructions.

6) All costs of a claim shall be met by Clipsal Australia Pty Ltd, however should the product that is the subject of the claim be found to be in good working order, all such costs shall be met by the claimant.

7) When making a claim, the consumer shall forward the Clipsal Product to the nearest office of Clipsal Australia Pty Ltd with adequate particulars of the defect within 28 days of the fault occurring. The product should be returned securely packed, complete with details of the date and place of purchase, description of load, and circumstances of malfunction.

For all warranty enquiries, contact your local Clipsal sales representative. The address and contact number of your nearest Clipsal Australia office can be found at http://www.clipsal.com/locations
